

3. Empirical Evidence & Market Traction

Validation & Impact

The AI Cognitive Debt
Unconstrained generative AI reliance severely degrades critical thinking, functional brain connectivity, and independent memory retention.

FIG 6. 47% Four Brain Connections: EES dDTF analysis reveals 42 significant alpha-band connections with ChatGPT vs 79 in Brain-only mode (Kosmyna et al., MIT 2025, $p < .05$).

Empirical Validation
Analytical thinking is the #1 future workforce requirement. Our validation proves parents urgently seek structured screen-time incentives.

FIG 7. Analytical thinking Ranked #1: 67% of employers rate analytical thinking as a core skill, followed by resilience (67%) and creative thinking (57%).

FIG 8. 83.3% Quoting Failure: 15 of 18 ChatGPT users failed to quote a single sentence from their own essay vs 11.1% in Brain-only and Search groups ($p < .001$).

FIG 8. High Commercial Intent: 11.1% paid intent rate without credit card friction validates high parental demand for earned screen time.

We don't ban AI, we prepare children for it.
The future generation will inevitably use AI. The fundamental question is whether they will command the algorithms, or let the algorithms command them. LogicLab Kids anchors screen time to structured reasoning to build genuine cognitive stamina.
