

What the market said

The market

Demand was tested against behaviour, not opinion: i made a landing page which presented LogicLab Kids as a finished product, with a fake paid sign-up at 5 Euro / month, this got sent to every parent at my school.

48 parents wanted a paid sign-up for a product that did not yet exist

20

families in the beta

100%

would subscribe again

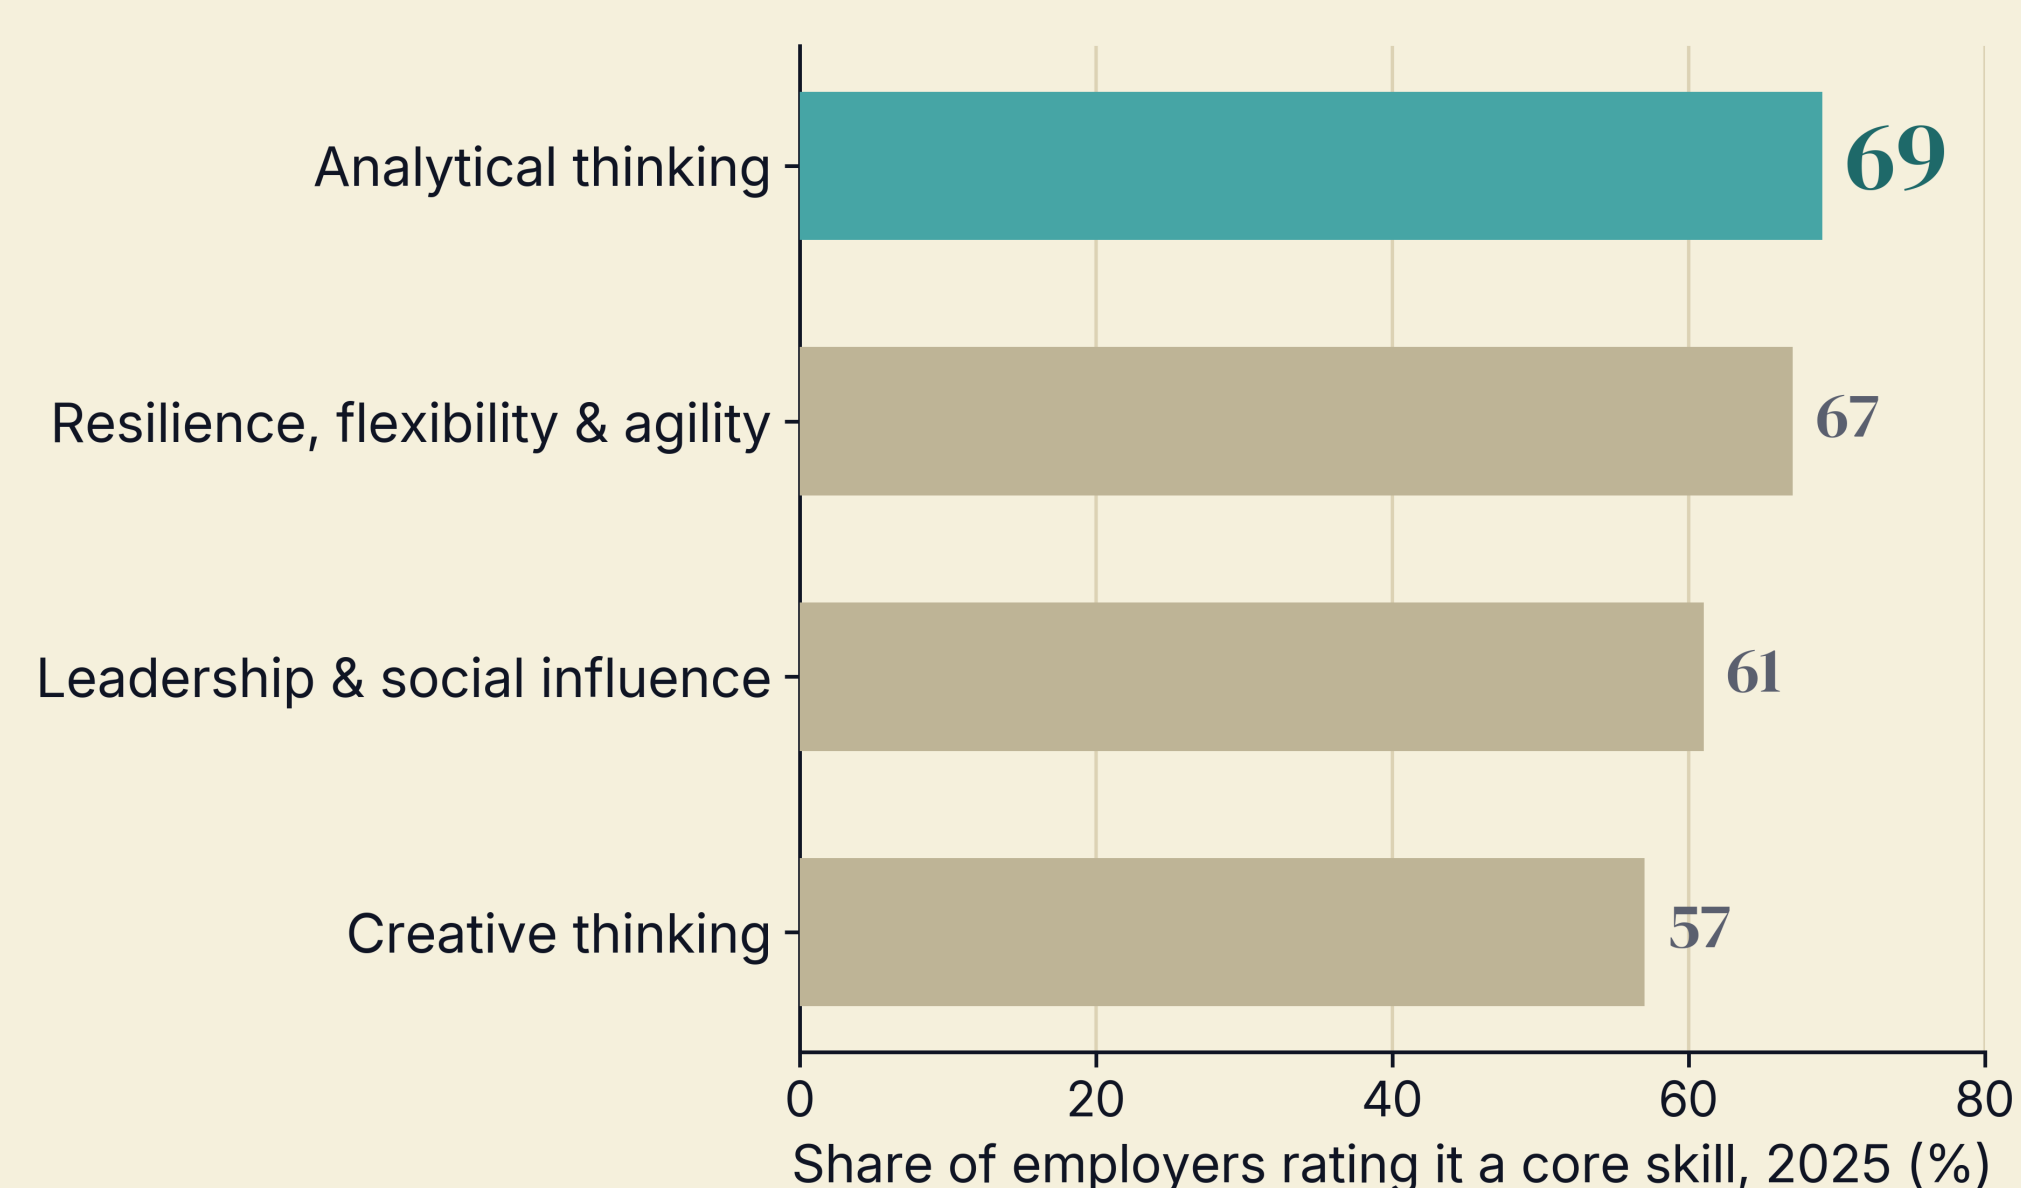

Twenty families from those sign-ups used an early build. Their reports converged: the children **thought more independently, reached for TikTok less**, and offered their own opinions more often.

What is **not yet proven**

Whether the app causes the change, and whether the reward sustains engagement without eroding the intrinsic motivation it is meant to build. The next phase answers both.

COHORT	30 children aged 7–11 plus a matched control group; pre/post design.
INSTRUMENTS	Raven Progressive Matrices (curriculum-independent reasoning); WPPSI-IV subtests indexing executive function.
IN-APP	tutor turns needed to reach a sound conclusion, tracked over time; parent and teacher questionnaire.
REWARD	screen time stepped down over the study: do engagement and reasoning persist as the extrinsic reward fades?

A controlled study, with a university faculty, published whatever the result. Until then: a hypothesis under test.

World Economic Forum (2025), The Future of Jobs Report 2025. Top four of the eight named. Figure: own work.

FIG 9. Analytical thinking is the #1 core skill employers name for 2030.

We don't ban AI, we prepare children for it.

A generative AI is neither hero nor villain in a child's education; it is whatever its design makes it: it offloads the child's thinking when built to answer and provokes it when built to ask. The application exists and runs, the demand is validated, and the limits are named: a controlled trial is next, the overjustification risk is monitored.
